

Any App. Any Server. Any Cloud.

Simple and affordable application virtualization for the desktop

AppZero for Windows Desktop

AppZero for Windows Desktop is a virtualization offering that separates an application from the OS, packaging it for quick deployment – perfect for loosely managed environments such as app stores and bring your own (BYO) scenarios. AppZero's application virtualization fits into existing environments using the resources and tools already in place.

AppZero – The Basics

AppZero creates a virtualized application that can be quickly deployed/ copied, executed, and maintained on any Windows operating system. And just as quickly be removed without a trace.

AppZero decouples Windows applications from Windows operating systems (XP, Vista, and Windows 7) for agentless execution in its virtualized environment. Applications are packaged into a capsule-like Virtual Application Appliance (VAA), along with dependencies such as binaries, configurations, registry settings, DLLs, and any services.

AppZero Desktop includes:

- Creator – creates VAAs
- Director – directs application execution
- Admin – administrative console for VAAs

AppZero application virtualization offers:

- Extreme simplicity – copy and run
- Flexibility – use any provisioning or management system; deliver apps from any type of storage
- On-demand delivery of applications as needed
- Consistent deployments based on a single app image
- Isolation from underlying OS and specific OS configurations
- Significantly lowered desktop TCO

Benefits of using AppZero Desktop:

- Package once, run everywhere
- Eliminate application conflicts (sandbox)
- Separate the upkeep/lifecycle of applications and OS
- AppZero offers AppZero for Windows Desktop as a perpetual license, free for enterprise use. Support and services are available online at www.appzero.com/buynow

Common Use Cases:

- Distribution of single applications rather than complete desktops
- Provisioning of rapidly changing desktops
- Applications on demand, part time use, and easy removal (as in personal cloud)
- BYO - Self-service user provisioning
- Simplified, cost-effective provisioning and update across an application's lifecycle
